Minimum Window Substring

Maintain a hashmap of characters in t and current window in s, only considering characters in t.

→ s_set[c] ≥ t_set[c] for c in t_set

While window is valid, try to shrink as much as possible.
While not valid, expand to make valid.

s = "OUZODYXAZV", t = "XYZ"

O	U	Z	O	D	Y	X	A	Z	V		
						L				R	

X : 1
Y : ~~1~~ 0
Z : ~~1~~ ~~0~~ 1

We need only check whether the character just added/removed affects the validity of our window, this helps avoid unnecessary repeated work.
