Car Fleet

target = 12, position = [10, 8, 0, 5, 3], speed = [2, 4, 1, 1, 3]

finish_times = [12, 3, 7, 1, 1] → sort by position, then calculate finish time ✓

Start at earlier position and finish earlier (or same time) ⇒ fleet

12 3 7

merge into one fleet finishing at time 7

12 7 1 1

merge into one fleet finishing at time 1

12 7 1

Use a monotonic decreasing stack

↓

finish times

fleets = # items on stack at the end
